"1000种姿势"绕过软WAF -- Python Fuzz脚本编写

主讲: V@1n3R.

团队:科拉实验室

2017 __

变量与输出字符串

```
counter = 100 # 赋值整型变量
miles = 1000.0 # 浮点型
name = "John" # 字符串
print (counter)
print (miles)
print (name)
print( "Hello world!" )
print( "Hello" +" world" )
a = 'hello'
b = 'world'
print(a+b)
```

条件判断(if):

```
age = 3
if age >= 18:
    print('your age is', age)
    print('adult')
else:
    print('your age is', age)
    print('teenager')
```

List (列表)

```
list = [] #声明list是一个列表,大前提!
list = ['a','b','c']
print(list)

a = ['a']
b = ['b']
c = ['c']
list = a+b+c #多个列表组合成一个列表
print(list)
```

迭代(遍历列表):

list = [1,2,3,'a','b','c']

for i in list: #循环遍历列表

print(i)

所需技能(二)requests库安装以及简单使用

requests安装

Python3 -m pip install requests OR pip3 install requests OR pip install requests

requests简介

```
import requests #导入requests库
requests.get( 'https://github.com/timeline.json' ) #GET请求 , 本次所需要用到的method requests.post( "http://httpbin.org/post" ) #POST请求
requests.put( "http://httpbin.org/put" ) #PUT请求
requests.delete( "http://httpbin.org/delete" ) #DELETE请求
requests.head( "http://httpbin.org/get" ) #HEAD请求
requests.options( "http://httpbin.org/get" ) #OPTIONS请求
```

所需技能(三)phpstudy下载安装

phpstudy安装

http://www.phpstudy.net/phpstudy/phpStudy20161103.zip

fuzz测试所需要的php文件

http://www.lz1y.cn/fuzz.zip

安装phpstudy的操作不在本次课程范围内,具体百度,也可以使用别的组件集成工具

Fuzz脚本思路

Waf(web应用防火墙)

Web应用防护系统(也称:网站应用级入侵防御系统。英文:Web Application Firewall,简称: WAF)。利用国际上公认的一种说法:Web应用防火墙是通过执行一系列针对HTTP/HTTPS的安全策略来专门为Web应用提供保护的一款产品。

检测sql注入

所谓SQL注入,就是通过把SQL命令插入到Web表单递交或输入域名或页面请求的查询字符串,最终达到欺骗服务器执行恶意的SQL命令。SQL 防护功能主要包括3点,分别是检测URL长度功能,检测URL非法功能和注入的防护规则。

而诸如狗狗此类防护产品都是正则匹配客户端发出的HTTP请求,然后拦截含有危险字符的请求已达到防护效果。

Bypass思路

本地搭建测试环境(mysql+apache)后,编写fuzz脚本利用环境特性爆破payload利用requests库发送请求,

打开web防护软件,过滤掉无效请求,根据response的content,来判断请求是否成功执行了注入。

"1000种姿势"绕过软WAF--Python Fuzz脚本编写

sqlmap请求 抓包

使用sqlmap的--proxy代理参数,即可使用burp查看sqlmap的注入请求。

举个栗子:

某狗敏感点 (Mysql数据库)

union select

含有information_schema等关键字的注入payload

一些mysql内置函数

等等..

更多的需要自己去fuzz测试,这里就不说了

Fuzz脚本实现

Fuzz

所谓fuzz也就是匹配模糊测试,这里我们就需要使用脚本来实现了

例如 很早之前 内联注入即可过狗(/*!union*/ /*!select*/ 1,2,3 --+), 现在狗狗的正则库也强大起来了。

不过还是有空可以钻。所以本次就使用内联注释来进行Fuzz。

Bypass实现

接下来就看我演示吧。

彩蛋--自动化注入:Tamper脚本实现

Tamper脚本

神器sqlmap中的tamper提供了不少有意思的且有用的脚本,用以绕过各种waf,奈何现在waf也摸透了神器的自带脚本。

使用方法 sqlmap.py -u url --tamper=tampername.py

Tamper脚本实现

tamper库中有不少优秀的脚本,我们可以仿照现成的脚本

, 修改成我们所需要的效果

脚本所在文件夹 : ./sqlmap/tamper

注意TAMPER脚本满足条件:

*Mysql数据库

*Apache or IIS特定防护产品

彩蛋--自动化注入:Tamper脚本实现

apostrophemask	用UTF-8全角字符替换单引号字符
apostrophenullencode	用非法双字节unicode字符替换单引号字符
appendnullbyte	在payload末尾添加空字符编码

versionedmorekeywords	用MySQL注释包围每个关键字
versionedkeywords	用MySQL注释包围每个非函数关键字
